

Ten Reasons to Choose CommVault® Simpana® Software for eDiscovery, Compliance and Information Access

Save Time and Money

- 1 **Mitigate the threat of sanctions and fines.** A proactive litigation response plan, like a disaster recovery or business continuity plan will reduce costly fees associated with litigation or non-compliance. CommVault® software allows you to produce, retrieve and review all discoverable information on demand, making it the most comprehensive and risk adverse solution that exists today.
- 2 **Reduce in-house eDiscovery burdens and costly outsourcing fees.** Cull and reduce the Electronically Stored Information (ESI) volume in-house, before being sent in for costly processing and review by an outsourced firm.
- 3 **Improve operational efficiencies.** Eliminate the IT bottleneck by empowering legal and business teams to conduct their own eDiscovery searches with an easy to use search interface. Keep IT out of sensitive eDiscovery searches, legal holds and internal investigations.

Streamline Data Management Processes & Information Access

- 4 **Leverage search across multiple data types with a single platform.** Reduce the amount of data repositories that need to be searched in response to litigation. Manage, identify, and search across all types of ESI, including files, email and applications, and across both backup and archive repositories, from a single console. With Content Indexing, federated search spans both online and offline data to rapidly to eDiscovery events.
- 5 **Address legal hold requirements across all ESI,** including relevant data from remote or branch offices. "One-click" legal holds preserve authenticity and integrity of data. Legal holds can be administered globally and/or selectively across the enterprise based on search criteria and/or custodian. A legal hold policy that spans both backup and archive eliminates the reckless disposal of evidence based on regular retention policies.
- 6 **Enable efficient, end-to-end eDiscovery, following the EDRM Model (www.edrm.net).** Information Management, Identification, Collection and Preservation of all Electronically Stored Information (ESI) can be managed from a single view in-house with CommVault software. Partnerships allow us to provide the Processing, Review, Analysis and Production of data, therefore delivering a complete eDiscovery solution, following the Electronic Discovery Reference Model.

Minimize Risk and Exposure

- 7 **Deliver a consistent, repeatable and defensible strategy for all ESI.** A holistic approach to managing all ESI from creation to proper disposition, *with one interface*, is a clear differentiator over other "point solutions" in the market.
- 8 **Improve competitiveness and decision making.** Provide an unprecedented level of business intelligence from all types of ESI, enabling you to make better informed decisions and be better prepared for performing early case assessments or opposing counsel negotiating (such as weighing the cost of going to court vs. the cost of settling).
- 9 **Provide audit-ready reporting.** Ensure privacy and chain-of-custody with "point and click" reporting to ease the audit burden.
- 10 **Ensure the integrity of original data.** Enable compliance with existing and evolving regulations and internal standards. Retention, access and proper disposition of unaltered data can reduce corporate liability and save reputation.
