

SOLUTION BRIEF

Commvault Cloud Dedicated Tenant

A dedicated SaaS deployment option that delivers the control and isolation enterprises need without sacrificing SaaS agility.

ISOLATED SAAS FOR ENHANCED COMPLIANCE AND CONTROL

Enterprises today face escalating pressure to protect sensitive data while meeting ever-tightening compliance and regulatory mandates. As data spreads across hybrid and multi-cloud environments, ensuring sovereignty, isolation, and governance has become increasingly complex. Governments worldwide are imposing stricter controls over where and how data is stored, processed, and accessed—elevating data sovereignty and cross-border governance to board-level priorities. [Exasol]

In this landscape, regulated enterprises must balance accountability and compliance with the speed and innovation of SaaS. The challenge is clear: maintain the agility of cloud operations while proving control, visibility, and isolation of critical workloads—or risk noncompliance and exposure.

FROM COMPLEXITY TO CLARITY

Organizations with stringent security, compliance, or sovereignty requirements often require dedicated SaaS environments that deliver greater control and isolation. Commvault Cloud Dedicated Tenant addresses this challenge by providing a dedicated SaaS deployment option that delivers the control and isolation enterprises need without sacrificing SaaS agility. Dedicated Tenant gives customers their own isolated SaaS environment, helping establish that compute, storage, and management resources are never shared across unrelated tenants.

KEY BENEFITS

- Help simplify audits and compliance with major frameworks like HIPAA, FedRAMP, and GDPR through isolated tenant infrastructure. Unified SaaS experience helps support continuous innovation and strict adherence to privacy requirements.
- More control over upgrades and feature rollout, though upgrade windows are enforced to provision most up-to-date UX.
- Enhanced control and isolation, allowing customers to select geographic regions for deployment and help meet data residency mandates.

As regulatory frameworks like DORA set higher standards for operational resilience, organizations are implementing strategies that integrate regulatory compliance with the ability to recover swiftly from cyber disruption. Together with Commvault and Kyndryl, we're delivering advanced security features and a scalable foundation of layered resilience that helps organizations meet these mandates and restore critical operations quickly and reliably."

WHY CHOOSE COMMVAULT CLOUD DEDICATED TENANT?

Productized Option

Commvault Cloud's Dedicated Tenant option provides the control and isolation enterprises expect from a private deployment, combined with the scalability, resilience, and feature velocity of a modern SaaS platform. Unlike other solutions that require customers to choose between a fully managed multi-tenant service or a complex self-hosted stack, Dedicated Tenant delivers a managed, single-tenant environment with full isolation. This model offers customers the confidence of helping improve compliance while preserving the agility of centralized updates, cloud-native innovation, and seamless integration across Commvault's platform.

Flexibility

Commvault offers unmatched flexibility across every deployment model, empowering customers to choose the right balance of control, performance, and scalability. Whether deployed as traditional software on-prem, software self-hosted in the customer's cloud, public cloud, or a dedicated tenant in the public cloud, Commvault delivers a consistent, enterprise-grade data protection experience with unified management and policy control across environments. This versatility ensures organizations can adapt seamlessly as their hybrid and multi-cloud strategies evolve.

Enterprise Credibility

Commvault already has a deep footprint in heavily regulated industries; Dedicated Tenant reduces friction for those customers to move to SaaS. The solution leverages Commvault's existing credibility and expertise in these sectors.

Unified Experience

The same feature set, UI, and innovation velocity are available across all deployment models, unlike competitors who fragment feature delivery between multi-tenant SaaS and bespoke/dedicated environments. This unified experience ensures consistency and reliability for customers.
